LAN COMMUNICATION TEST

1, Explain uses of ping command in network ?

* It is used to check the network connectivity and find out whether a device is reachable or not. It is used to find the network delay (latency). Easy to find out whether the ip used or not.

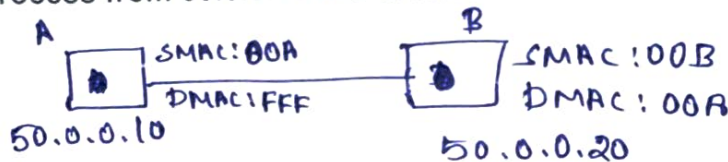

2, Explain netbios protocol ?

* Netbios allows the computer to identify and communication with each other using the computer names rather than only Ip. In this case system name correctly ^{should be} configured.
ex: Ping sgs1

3, Explain SMB protocol ?

* SMB stands for server message Block. It is a network protocol is used to share files, folders, Printers and other resources between computer over network.

4, Explain ping process from 50.0.0.10 to 50.0.0.20 ?

In system A if we ping the ^{destination} ip 50.0.0.20 it checks the destination mac at the time destination mac does not know sys A. So here ARP request will come. That time it ~~will save the source mac~~ time it will broadcast to which all the devices connected between the network. Only mentioned destination ip only able to view the data other are drop the data. Once arp request reached to destination ip it will unicast to source device. After that 8 ICMP request and reply will get.
